descriptive analyses of sent messages, delivered messages and estimation of adherence based on messages.

Results We enrolled 25 women. In total, 4963 messages were sent of which 40 failed to be delivered (1%). 1664 SMS were sent with a question if medication was taken, which received an answer 1580 times (91%). The answer was 'Yes' in 1137 cases (65%), 'No' in 10 cases (0.6%) and indefinable in 433 cases (26%). The median adherence based on 'Yes'-answers was 74% [range 24–99]. If also counting the indefinable answers, the mean adherence was 100% [range 95–100].

Conclusion Despite a few technical issues, we believe using SMS for reminder cues in Tanzania works well. The number of failed deliveries is nearly zero and women have replied to the majority of SMS. Efforts are needed to instruct women better on replying and on detecting the right answer in case of typing errors. We conclude that using SMS has potential to improve adherence and should be further investigated in clinical trials to determine the effect on adherence to treatment.

PO 8481 HIGH HEPATITIS B VIRUS INCIDENCE AMONG HIV-1-INFECTED TREATMENT-NAIVE ADULTS IN BOTSWANA

¹Bonolo B Phinius*, ¹Resego Bokete, ^{1,2}Motswedi Anderson, ^{1,2}Tshepiso Mbangiwa, ¹Wonderful Choga, ^{1,3}Sikhulile Moyo, ^{1,3}Rosemary Musonda, ⁴Richard Marlink, ^{1,3}Simani Gaseitsiwe. ¹Botswana Harvard AIDS Institute Partnership, Gaborone, Botswana; ²University of Botswana, Gaborone, Botswana; ³Harvard T.H. Background Hepatitis B virus (HBV) is one of the leading causes of death worldwide despite a moderately potent vaccine. HBV prevalence has been shown to be higher in patients infected with the human immunodeficiency virus (HIV), hence increased liver-related morbidity and mortality, as well as general poor health outcomes in HIV-HBV co-infection. We estimated the HBV incidence among HIV-1-infected treatment-naïve adults in a longitudinal cohort in Botswana.

Methods Plasma samples from 200 HIV-1C-infected treatment-naïve participants from a completed longitudinal cohort from 2004 to 2007 were screened for HBV surface antigen (HBsAg). HBsAg was assessed using Murex version 3 enzyme-linked immunosorbent assay as per manufacturer's instructions at 4 timepoints, 12 months apart. We estimated HBV incidence with 95% confidence interval (CI). Cox proportional regression method was used to estimate hazard ratios [gender, age (≤ 35 or > 35) years, CD4⁺ T cell count (≤ 450 or > 450) cells/ μ L and HIV viral load suppression (≤ 400 or > 400) copies/mL].

Results The median age of screened individuals was 32 years [Q1, Q3; 28, 40] and 83.5% [167/200] were female. Baseline median CD4⁺ T cell count was 466.35 cells/ μ L [Q1, Q3: 380.43, 605.75] and median HIV viral load was 13 450 copies/mL [Q1, Q3: 2365, 37 400]. The HBV incidence was 3.6/100 person-years [95% CI: 2.2–5.6]. There were no significant differences by gender, age, HIV viral load suppression and CD4⁺ T cell count.

Conclusion We report for the first time a high HBV incidence among HIV-infected adults in Botswana. HBV incidence was high in this population despite generally high CD4⁺ T cell counts and lower HIV viral loads. Early screening of HBV in HIV-infected individuals is vital and should be included in the national HIV treatment guidelines.

PO 8483 ASSOCIATIONS BETWEEN HIV AND OTHER STIS AMONG GAY, BISEXUAL MEN AND TRANSGENDER WOMEN IN NAIROBI, KENYA

¹Rodah Wanjiru*, ²Joshua Kimani, ³Adrian Smith. ¹Partners for Health and Development in Africa, Nairobi, Kenya; ²Partners for Health and Development in Africa, Nairobi, Kenya; ³University of Oxford, Nuffield Department of Population Health, Old Road Campus, Oxford, UK

10.1136/bmjgh-2019-EDC.116

Background Men who have sex with men (MSM) are a key target population for HIV prevention and control in Kenya. Although male sex workers remain the focus of research in Nairobi, HIV/STI prevalence has not been assessed among the wider MSM population since 2010. This study set out to reassess prevalence and associations of HIV and other STIs.

Methods Respondent-driven sampling recruited 618 MSM. Eligibility criteria were age 18+, male (birth or currently), Nairobi residence and consensual oral or anal intercourse with a man in the last year. Consenting participants completed an online survey including current experience of STI symptoms. Participants tested for HIV [Determine, First Response [2nd gen] and GeneXpert HIV-Qual [4th gen]], syphilis [RPR/TPHA], hepatitis B and C [HBsAg and HCV ELISA], urine and rectal chlamydia and gonorrhea [GeneXpert CTNG]. Associations with prevalent HIV were assessed using multivariate logistic regression.

Results HIV prevalence was 26.4% [22.6–30.6] including 0.5% [0.2–1.5] detected solely on 4th gen testing. Prevalent HIV was independently associated with age, lower education, Kenyan birth, transgender identity and exclusive sex with men in the past 3 months but dependently associated with STI symptoms. Prevalence of syphilis was 0.8% [0.3–1.9]; hepatitis B 4.4% [3.4–6.9]; hepatitis C 0.5% [0.2–1.5]. Current symptoms consistent with urethritis were reported by 6.4% [4.5–9.0] of participants. Prevalence of urethral GC and CT were 4.4% [2.9–6.7] and 7.3% [5.2–10.3] respectively. Symptoms consistent with proctitis were reported by 8.6% [6.3–11.6] of participants. The prevalence of rectal GC and CT were 13.3% [10.4–16.8] and 8.7% [6.7–11.2] respectively. Overall, only 17.7% [9.2–31.2] of participants with urethral CT/NG and 17.8% [10.7–28.0] rectal CT/NG were symptomatic.

Conclusion The burden of HIV among gay, bisexual and other MSM (GBMSM) remains considerably higher than other men in Nairobi, whilst the prevalence of syphilis and hepatitis C are relatively low. Chlamydia and gonorrhoea infections, particularly rectal, are common and frequently asymptomatic. Capacity of GBMSM-friendly and community-based providers to offer CT/NG screening should be prioritised.

PO 8485 INTERFERON GAMMA RESPONSE KINETICS IN TUBERCULOSIS PATIENTS AND HOUSEHOLD CONTACTS IN THE GAMBIA
