Background
Awareness of data management (DM) is often restricted to ‘the cost of computers’ or ‘the need for a database’. Recently, ‘data sharing’ can be added to this shortlist. Indeed, in recent years data sharing became often required or so strongly promoted that the importance of all other aspects related to DM or data handling in clinical tended still to be overlooked. However, the development of data sharing guidelines and associated privacy regulations (e.g. the EU General Data Protection Regulation) created a new momentum for highlighting the importance of qualitative data management.

Methods
An overview of DM processes is given, within the framework and challenges of conducting non-commercial clinical trials in North-South partnerships.

Results
The DM workflow of a clinical trial is presented, highlighting essential DM tasks, deliverables and milestones. Pre-study tasks and deliverables are addressed: SOPs, a data management plan, the implementation of a GCP-compliant valid data management system and compliance to data quality, privacy, security and standards (e.g. MedDRA, CDISC).

Subsequent study-specific processes including the collection, entry, querying and cleaning of the data are discussed. In addition, DM metrics important to guide quality, productivity and timelines are reviewed while considering their impact on post-study activities such as data sharing.

Conclusion
Data sharing is only one of many DM tasks, at the end of the DM workflow. Focusing too much on data sharing while neglecting other DM aspects might lead to underestimating the workload, resources, quality assurance and time needed for data management and by and large for the trial itself. Integrating data sharing into a holistic vision on data management is paramount for clinical research.
or Fisher’s exact tests as appropriate. Multivariate analysis including logistic regression models will be used to test for associations between maternal characteristics and SP resistance. Level of significance will be set at p<0.05.

Conclusion In a malaria-endemic country like Nigeria with a large at-risk population, information on the effectiveness of chemoprevention is essential. Determining the proportion and extent of relevant molecular markers within the population offers an invaluable tool for epidemiological surveillance of SP resistance within this endemic setting.

PO 8503 EPIDEMIOLOGY, CO-INFECTIONS AND HAEMATOLOGICAL FEATURES OF SCHISTOSOMIASIS IN SCHOOL-AGED CHILDREN LIVING IN LAMBARÉNÉ, GABON

1Jean Claude Dejon Agobe*, 1Yabo J Honkpehedji, 1Jeanot Fréjus Zinsou, 1Jean-Ronald Edoa, 1Bayoide R Adegbite, 1Mohamed Duai, 1Fabrice L Mougeni, 1Bertrand Lell, 2Peter G Kremsner, 1Martin P Grobusch, 1Ayola Akim Ademgakia, 1Centre de Recherches Médicales de Lambaréné, Libreville, Gabon; 1Institut für Tropenmedizin, Eberhard Karls Universität Tübingen and German Center for Infection Research (DZIF), Germany; 2Academic Medical Center, University of Amsterdam, the Netherlands

10.1136/bmjgh-2019-EDC.123

Background Schistosomiasis is a highly prevalent parasitic infection in Central Africa, where co-endemicity with other parasitic infections is common, and schistosomiasis outcomes can be affected by those other infections. Therefore, proper schistosomiasis control needs epidemiological data accounting for co-infections, too. In this present study, our objective was to determine the epidemiological situation around schistosomiasis in Lambaréné.

Methods A cross-sectional study was conducted among school-aged children living in Lambaréné. Urine filtration exam was performed for the detection of Schistosoma eggs. Kato-Katz and stool culture (Coproculture and Harada-Mori) techniques were used for the detection of soil-transmitted helminths. Detection of Plasmodium spp. and blood microfilariae was performed applying light microscopy. Risk factors for schistosomiasis and factors associated with schistosomiasis were investigated; haematology parameters evaluated.

Results A total of 614 school children with available schistosomiasis status were included in the analysis. Mean age was 10.9 (SD=2.7) years, with a 0.95 boy-to-girl sex ratio. The prevalence of schistosomiasis was 26%. No risk factors except human-water contact were associated with schistosomiasis. Only Trichuris triichiura co-infection was associated with an increased odd (aOR=2.3, p-value=0.048) to be infected with schistosomiasis. Full blood counts showed a decrease of haemoglobin level and increase of WBC and platelet levels among the schistosoma-infected children. Haematuria was found associated with schistosomiasis (aOR=14.5, p-value<0.001) and was suitable to predict the disease.

Conclusion The prevalence of schistosomiasis is moderate in Lambaréné where human-water contact remains the main risk factor and praziquantel is available for treatment. Trichuriasis is associated with increased risk to be infected. Children with schistosomiasis exhibit a distinct full blood count profile and haematuria is found to be more suitable to predict infection. However, it is desirable to implement comprehensive approaches beyond chemotherapy for schistosomiasis control in this area as recommended by WHO.

PO 8504 EFFECT OF INCREASED USER FEES IN ACCESSING NEW TUBERCULOSIS DIAGNOSTIC SERVICES IN TANZANIA

1Esther Ngadya*, 1Godfather Kimaro, 2Ramadhani Shemtandulo, 1Erica Sandi, 2Sunday Simakoe, 1Silva Nquma, 3Omari Kibwana, 4Nicholas Mjiga, 5Godfrey M Mtinanga, 6National Institute for Medical Research, Muhimbili Research Centre, Dar es Salaam, Tanzania; 5Sumbawanga Regional Hospital, Sumbawanga, Tanzania; 6Minazi Mmoja Hospital Zanziba, Tanzania; 6Musoma Regional Hospital, Tanzania

10.1136/bmjgh-2019-EDC.124

Background While user fees in healthcare systems have been associated with quality improvement, a substantial increase may have a detrimental effect. This paper reports on the effects of increasing user fees on utilisation of TB diagnostic services in Tanzania.

Methods We retrospectively analysed data on TB diagnostic services utilisation between July 2013 and June 2015 in Minazi Mmoja Zanzibar (MMZ), Musoma and Sumbawanga hospitals. In July 2014, user fees in Musoma were increased substantially from 2 to 5 US dollar; Sumbawanga increased the fees stepwise, from 1 to 2 US dollar in July 2014, and from 2 to 3 US dollar in January 2015. MMZ did not raise the fees. We compared TB services utilisation before and after introduction of user fees.

Results Out of 7483 presumptive TB patients registered in all sites, 50.2% were males. Over half (3969) were registered before the user fee was increased. Among 3969, 1579 (39.8%) were from Musoma, 922 (23.2%) from Sumbawanga and 1468 (37.0%) from MMZ. Of the 3514 patients registered after the introduction of user fees, 983 (28%), 952 (27.1%) and 1579 (49.4%) patients were from Musoma, Sumbawanga and MMZ, respectively. The number of presumptive TB patients seeking TB diagnostic services at Musoma decreased significantly by 38% from 1579 to 983 after the increase of user fees (p=0.001). More females (817; 51.8% vs 458, 35.9%) attended Musoma before user fees were increased as compared to males whose attendance did not differ much (761; 48.2% vs 525; 53.4%); (p=0.01). There was no significant decrease of patients at Sumbawanga and MMZ.

Conclusion There was a significant decrease in the number of presumptive TB patients who accessed new TB diagnostic services in Musoma after a substantial increase of user fees, the effect was stronger among women. Although user fees are beneficial, they should be increased stepwise so as not to affect service utilisation.

PO 8505 LEISHMANIASIS IN ANGOLA – AN EMERGING DISEASE?

1Sofia Cortes, 1André Pereira, 2Jocelyne Vasconcelos, 2Joana P Paixão, 3João Quinina, 2Joana De Morais Afonso, 1José M Cristovão, 1Linea Campino, 1Global Health and Tropical Medicine Center, Instituto de Higiene e Medicina Tropical (IHMT), Universidade Nova de Lisboa, Portugal; 3Instituto Nacional de Saúde Pública, Ministério da Saúde de Angola, Angola

10.1136/bmjgh-2019-EDC.125

Background Poverty, lack of resources, inadequate treatments and control programmes exacerbate the impact of infectious diseases in the developing world. Leishmaniasis is a vector-borne disease that is among the ten major neglected tropical diseases. Although endemic in more than 90 countries, the ones most affected, representing over 90% of new cases, are Bangladesh, Brazil, Ethiopia, India, Kenya, Nepal, and Sudan. In Africa south of the equator, the impact of leishmaniasis is...
