*The conceptual framework draws on a range of existing frameworks and models that are relevant to the organization of primary health care (PHC) including: the Primary Health Care Performance Initiative Conceptual Framework of high functioning PHC systems; ¹⁰⁰ the World Health Organization's health system building blocks; ¹⁰¹ models of chronic care; ^{102, 103} proposed primary care models for non-communicable diseases in lowand middle-income country settings; ¹⁰⁴ and, the delivery system domains proposed by Lewin et al. ¹⁰⁵ The word 'organization' is used in this study as a broad concept with implications for a range of health systems functions (e.g. governance and service delivery) and performance (e.g. quality and equity).
